STUDIES RELATED TO WILDERNESS

Bureau of Land Management Wilderness Study Areas

The Federal Land Policy and Management Act (Public Law 94-579, October 21, 1976) requires the U.S. Geological Survey and the U.S. Bureau of Mines to conduct mineral surveys on certain areas to determine their mineral values, if any. Results must be made available to the public and be submitted to the President and the Congress. This report presents the results of a geochemical survey of the New Water Mountains Wilderness Study Area (AZ-020-125), La Paz County, Arizona.

INTRODUCTION

In 1984 and 1985, the U.S. Geological Survey conducted a reconnaissance geochemical survey of New Water Mountains Wilderness Study Area, La Paz County, Arizona.

The part of the study area on which surveys were conducted comprises about 21,680 acres (34 mi^2) (87 km^2) in the La Paz County, Arizona, and lies about 11 mi (18 km) east-southeast of Quartzsite. Access to the study area is provided on the south by a pipeline road which intersects U.S. 95 approximately 5.5 mi south of Quartzsite and on the north by several dirt roads leading south from Interstate 10. Much of the area is inaccessible except by foot. Throughout this report, "study area" and "wilderness study area" refer only to the part of the study area mentioned above.

Most of the eastern two-thirds of the study area is underlain by Tertiary volcanic rocks. In the western third of the area, Mesozoic sedimentary rocks are exposed on the flanks of Black Mesa, which is capped by basalt of Tertiary and (or) Quaternary age.

The topographic relief in the study area is about 2,000 ft (610 m) with a maximum elevation of 3,639 ft (1,109 m) at the top of Black Mesa. The eastern border of the study area is marked by a narrow, steep-walled, and sharp-crested ridge dissected by numerous washes on both flanks. The central part of the study area consists of a poorly defined group of rounded hills and short ridges separated by dendritic washes. The topography of the western part of the sandy area is dominated by Black Mesa. The climate is arid to semiarid.

METHODS OF STUDY

Sample Media

Analyses of the stream-sediment samples represent the chemistry of the rock material eroded from the drainage basin upstream from each sample site. Such information is useful in identifying those basins which contain concentrations of elements that may be related to mineralization. Heavy-mineral-concentrate samples provide information about the chemistry of certain minerals in rock material eroded from the drainage basin upstream from each sample site. The selective concentration of minerals, many of which may be ore related, permits determination of some elements that are not easily detected in stream-sediment samples.

Analyses of unaltered or unmineralized rock samples provide background geochemical data for individual rock units. On the other hand, analyses of altered or mineralized rocks, where present, may provide useful geochemical information about the major- and trace-element assemblages associated with a mineralizing system.

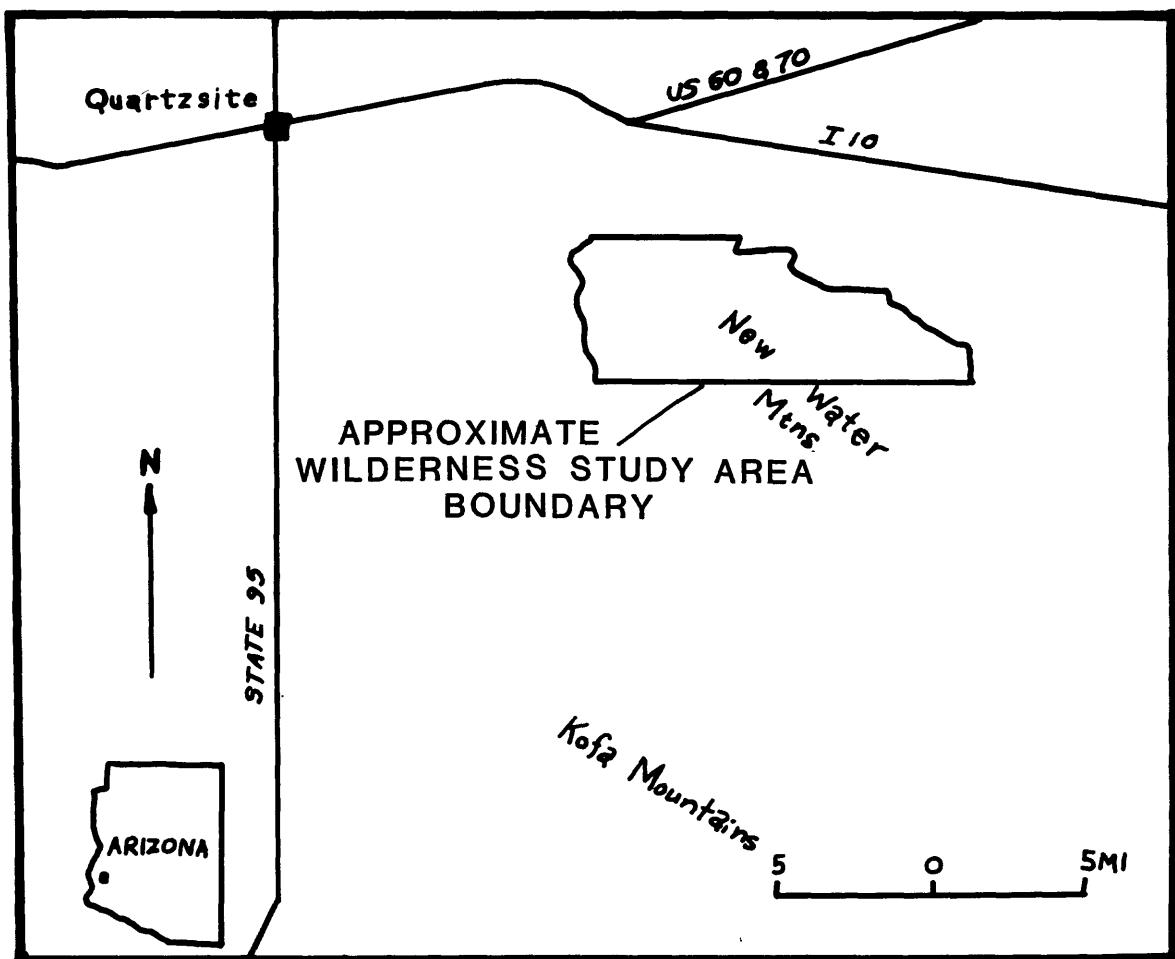

Figure 1. Location map of the New Water Mountains Wilderness Study Area, La Paz County, Arizona.

Sample Collection

Sediment samples were collected at 127 sites (plate 1). At nearly all of those sites, both a bulk stream-sediment sample and a heavy-mineral-concentrate sample were collected. The area of the drainage basins sampled ranged from 0.5 mi² to 5 mi². One hundred thirty rock samples were collected at 46 sites.

Stream-sediment samples

The stream-sediment samples consisted of active alluvium collected primarily from first-order (unbranched) and second-order (below the junction of two first-order) streams as shown on USGS topographic maps (scale = 1:62,500). Each sample was composited from several localities within an area that may extend as much as 20 ft from the site plotted on the map.

Heavy-mineral-concentrate samples

Heavy-mineral-concentrate samples were collected from the same active alluvium as the stream-sediment samples. Each bulk sample was screened with a 2.0-mm (10-mesh) screen to remove the coarse material. The less than 2.0-mm fraction was panned until most of the quartz, feldspar, organic material, and clay-sized material were removed.

Rock samples

Rock samples were collected from outcrops or exposures in the vicinity of the plotted site location. Samples collected represent both unaltered and altered/mineralized rocks. Table 6 gives a brief description of the rock samples.

Sample Preparation

Stream-sediment samples

The stream-sediment samples were air dried, then sieved using 80-mesh (0.17-mm) stainless-steel sieves. The portion of the sediment passing through the sieve was saved for analysis.

Heavy-mineral-concentrate samples

After air drying, bromoform (specific gravity 2.8) was used to remove the remaining quartz and feldspar from the heavy-mineral-concentrate samples that had been panned in the field. The resultant heavy-mineral sample was separated into three fractions using a large electromagnet (in this case a modified Frantz Isodynamic Separator). The most magnetic material, primarily magnetite, was not analyzed. The second fraction, largely ferromagnesian silicates and iron oxides, was saved for archival storage. The third fraction (the least magnetic material which may include the nonmagnetic ore minerals, zircon, sphene, etc.) was split using a Jones splitter. One split was hand ground for spectrographic analysis; the other split was saved for mineralogical analysis. These magnetic separates are the same separates that would be produced by using a Frantz Isodynamic Separator set at a slope of 15° and a tilt of 10° with a current of 0.2 ampere to remove the magnetite and

ilmenite, and a current of 06 ampere to split the remainder of the sample into paramagnetic and nonmagnetic fractions.

Rock samples

Rock samples were crushed and then pulverized to minus 0.15 mm with ceramic plates.

Sample Analysis

Spectrographic method

The heavy-mineral-concentrate and rock samples were analyzed for 31 elements using a semiquantitative, direct-current arc emission spectrographic method (Grimes and Marranzino, 1968). The elements analyzed and their lower limits of determination are listed in table 1. Spectrographic results were obtained by visual comparison of spectra derived from the sample against spectra obtained from standards made from pure oxides and carbonates. Standard concentrations are geometrically spaced over any given order of magnitude of concentration as follows: 100, 50, 20, 10, and so forth. Samples whose concentrations are estimated to fall between those values are assigned values of 70, 30, 15, and so forth. The precision of the analytical method is approximately plus or minus one reporting interval at the 83 percent confidence level and plus or minus two reporting intervals at the 96 percent confidence level (Motooka and Grimes, 1976). Values determined for the major elements (iron, magnesium, calcium, and titanium) are given in weight percent; all others are given in parts per million (micrograms/gram). Analytical data for samples from the New Water Mountains Wilderness Study Area are listed in tables 3-5.

Chemical methods

Other methods of analysis used on samples from the New Water Mountains WSA, are summarized in table 2.

Analytical results for stream-sediment, heavy-mineral-concentrate, and rock samples are listed in tables 3, 4, and 5, respectively.

ROCK ANALYSIS STORAGE SYSTEM

Upon completion of all analytical work, the analytical results were entered into a computer-based file called Rock Analysis Storage System (RASS). This data base contains both descriptive geological information and analytical data. Any or all of this information may be retrieved and converted to a binary form (STATPAC) for computerized statistical analysis or publication (VanTrump and Miesch, 1977).

DESCRIPTION OF DATA TABLES

Tables 3-5 list the results of analyses for the samples of stream sediment, heavy-mineral concentrate, and rock, respectively. For the three tables, the data are arranged so that column 1 contains the USGS-assigned sample numbers. These numbers correspond to the numbers shown on the site location maps (plate 1). Columns in which the element headings show the letter "s" below the element symbol are emission spectrographic analyses; "aa"

indicates atomic absorption analyses; "inst" indicates an instrumental technique; "cm" indicates colorimetric analyses; and "si" indicates specific ion analyses. A letter "N" in the tables indicates that a given element was looked for but not detected at the lower limit of determination shown for that element in table 1. If an element was observed but was below the lowest reporting value, a "less than" symbol (<) was entered in the tables in front of the lower limit of determination. If an element was observed but was above the highest reporting value, a "greater than" symbol (>) was entered in the tables in front of the upper limit of determination. If an element was not looked for in a sample, two dashes (--) are entered in tables 3-6 in place of an analytical value. Because of the formatting used in the computer program that produced tables 3-5, some of the elements listed in these tables (Fe, Mg, Ca, Ti, Ag, and Be) carry one or more nonsignificant digits to the right of the significant digits. The analysts did not determine these elements to the accuracy suggested by the extra zeros.

TABLE 6.--Description of rock samples from the New Water Mountains WSA

| Sample Number | Rock Description |
|---------------|--|
| KR-0011R | Volcanic rock |
| KR-0012RA | Vesicular volcanics |
| KR-0012RB | Volcanic rock with Mn-oxide veinlets |
| KR-0012RC | Vesicular volcanic with Mn oxides |
| KR-0012RD | Vesicular volcanics |
| KR-0025R | Quartz vein with siderite |
| KR-0028R | Quartz vein with siderite and oxidized sulfides |
| KR-0044R | Vitrophyre |
| KR-0073R | Vesicular volcanics with Cu oxide in vugs |
| KR-0075RA | Fault breccia of volcanics and Cu oxides |
| KR-0075RB | Fault breccia of volcanics and Cu oxides |
| KR-0088R | Quartz vein with osidized sulfides |
| KR-0090RA | Brecciated quartz vein with calcite and Fe and Cu oxides |
| KR-0090RB | Quartz vein with boxwork limonite and minor Cu oxides |
| KR-0090RC | Brecciated quartz vein with limonite boxworks |
| KR-1137R | Shale |
| KR-1138R | Quartz vein with Cu oxides |
| KR-1162R | Quartzite |
| KR-1163R | Rhyolite |
| KR-1164R | Rhyolite |
| KR-1165R | Fe-oxide stained rhyolite |
| KR-1166R | Brecciated vein of Cu oxides and Fe oxides |
| KR-1168R | Dacite flow |
| KR-1169R | Dacite flow |
| KR-1170R | Dacite flow |
| KR-1171R | Basalt |
| KR-1172R | Basalt flow |
| KR-1173R | Basalt flow |
| KR-11174R | Siltstone |
| KR-1175R | Rhyolite flow |
| KR-1176R | Obsidian |
| KR-1177R | Basalt flow |
| KR-1178R | Rhyolite plug |
| KR-1179R | Quartz vein |
| KR-1180R | Mn-oxide rich vein |
| KR-1181R | Vein of quartz, calcite, Mn-Fe oxides |
| KR-1182R | Dark,gray, calcite vein |
| KR-1183R | Graywacke with Fe-oxide vein |
| KR-1184R | Andesite |
| KR-1185R | Fe-oxide stained adamellite with quartz vein |
| KR-1186R | Quartz vein with Fe oxides |
| KR-1187R | Quartz vein |
| KR-11884 | Quartz vein with Fe and Cu oxides and sulfides |
| KR-1189R | Quartz vein with Fe and Cu oxides and sulfides |
| KR-1190R | Quartz vein |
| KR-1191R | Quartz vein with calcite, Fe oxides, and pyrite |

TABLE 6.--Continued

| | |
|----------|---|
| KR-1192R | Quartz veing with Cu and Fe oxides |
| KR-1193R | Quartz vein with galena, pyrite, and Fe oxides |
| KR-1194R | Calcite vein with pyrite |
| KR-1195R | Calcite and quartz vein with sulfides and Cu and Fe oxides |
| KR-1196R | Shear zone containing Fe and Cu oxides |
| KR-1197R | Brecciated quartz vein with Fe and Cu oxides |
| KR-1198R | Fe-stained felsite |
| KR-1199R | Sandstone |
| KR-1200R | Siltstone |
| KR-1201R | Sandstone |
| KR-1202R | Mineralized quartz vein |
| KR-1203R | Phyllite |
| KR-1204R | Mineralized quartz vein |
| KR-1205R | Mineralized quartz vein |
| KR-1209R | Mineralized quartz vein |
| KR-1210R | Mineralized quartz vein |
| KR-1211R | Rhyolite with Cu oxides and Fe staining |
| KR-1212R | Rhyolite |
| KR-1213R | Basalt with Fe-stained quartz veins and Cu oxides |
| KR-1223R | Rhyolite plug |
| KR-1224R | Sandstone |
| KR-1225R | Sandstone |
| KR-1226R | Sandstone |
| KR-1227R | Fe-stained sandstone with quartz and calcite veins |
| KR-1228R | Calcite vein |
| KR-1229R | Dacite |
| KR-2000R | Tourmaline schist |
| KR-2001R | Quartz vein with limonite pseudomorphs after pyrite and minor copper staining |
| KR-2002R | Limonite boxworks |
| KR-2003R | Micaceous phyllite with limonite pseudomorphs |
| KR-2004R | Quartz vein with hematite and malachite |
| KR-2008R | Quartz vein with galena and copper staining |
| KR-2009R | Calcite vein with pyrite |
| KR-2010R | Black, brecciated calcite, limonite, quartz, and gypsum |
| KR-2011R | Limonite |
| KR-2012R | Dolomite breccia cemented by Fe oxides |
| KR-2013R | Limonite |
| KR-2014R | Black, carbonaceous dolomite |
| KR-2015R | Fe-stained siliceous vein |
| KR-2016R | Quartzite breccia with copper staining |
| KR-2017R | Silicic volcanics with chrysocolla |
| KR-2018R | Rhyolite |
| KR-2019R | Rhyolite breccia with copper staining |
| KR-2020R | Black, brecciated calcite |
| KR-2021R | Quartz with Mn oxides |
| KR-2022R | Black calcite vein |
| KR-2066R | Mn-oxide rich rock |

TABLE 6.--Continued

| | |
|----------|---|
| KR-2067R | Quartz vein with limonite boxworks, calcite, and gypsum |
| KR-3013R | Volcanic rock |
| KR-3038R | Quartz and Mn oxides |
| KR-5043R | Cu-stained quartz vein |
| KR-5044R | Micaceous phyllite |
| KR-5045R | Brown, dolomitic phyllite |
| KR-5046R | Sulfide-bearing quartz vein |
| KR-5047R | Quartz vein |
| KR-5048R | Quartzite |
| KR-5049R | Dolomitic sandstone with quartz and tourmaline veins |
| KR-5050R | Quartz vein |
| KR-5051R | Brecciated quartz vein with Cu oxides, hematite, and siderite |
| KR-5052R | Sandy metamorphic rock |
| KR-5053R | Quartz monzonite |
| KR-5054R | Quartz vein with siderite |
| KR-5055R | Sandy metamorphics with oxidized sulfides |
| KR-5056R | Quartz vein |
| KR-5057R | Quartz monzonite |
| KR-5058R | Quartz vein |
| KR-5059R | Quartz vein |
| KR-5060R | Muscovite-rich phyllite |
| KR-5061R | Quartz vein |
| KR-5062R | Altered phyllite with pyrite |
| KR-5063R | Phyllite with pyrite |
| KR-5064R | Dark, siliceous marble |
| KR-5065R | Quartz and marble |
| KR-5066R | Siliceous dolomite |
| KR-5067R | Mafic dike |
| KR-5068R | Quartzite |
| KR-5069R | Fine-grained quartz-feldspar-chlorite metamorphic rock |
| KR-5070R | Quartz in phyllite |
| KR-5071R | Black, siliceous rock |
| KR-5072R | Vuggy, andesitic volcanics |
| KR-5073R | Altered andesitic volcanics |
| KR-5074R | Black, silica veinlets |
| KR-5075R | Black, silica veinlets |
| KR-5175R | Limonite pseudomorphs after pyrite |
| KR-5176R | Quartz vein |
